Air Ride Management Cradle, Do I need one for my Build?

Guide | 11 Aug 2021 | Limebug Guide

The Purpose

For those who are familiar with fitting Air Suspension, the managment system can easily become a maze of wiring/airline. Caused sometimes by a lack of space, or other times a lack of planning, we decided to figure out a solution.

We designed a flat metal plate, with a carefully considered set of slots/pin holes to mount all kinds of management kits. Utilising these cutouts, the plate keeps your wiring/airlines completely seperate; keeping the setup easy to adjust if ever needed. The mounting slots for the tank and compressor/s allow position adjustment, to dial in the perfect settings for your mangment combination. Furthermore, the design of the plate has been thought out with aesthetics in mind. As seen in the imagery found in this article, the Managment Cradle can also be used for display purposes.

Mainly aiming our product development towards the aircooled community, we designed a series of brackets as an extension of our Universal Design, which bolt in directly to a range of Volkswagens (view the range below).
